Selecting more than 1 column in a sub-select *is possible*. I learned this tip from Jochem van Dieten (who knows more about SQL than anyone I know) on a recent **CF-Talk** thread. According to Jochem you can use the following Syntax:

```
<Cfquery ... >
SELECT * FROM table
WHERE (x, y) IN
      (SELECT a, b FROM otherTable)
</CFQUERY>
```

...Now ya gotta admit that's pretty neat!

**Note:** This syntax will not work on every db server. It will not work on MS SQL server for example. See the notes below for more detail
