I have had a great many readers calling me and asking about the 2D barcode CFC mentioned in a recent post. You will be happy to know that it has been released. You can use this CFC to create 2D barcodes for printing and to read 2D barcodes contained in images. You can find the download link and read more about it on [Ryan's blog](#). Keep in mind that the CFC is specific to CF8 and it uses a commercial (albeit inexpensive) Java library from Java4Less. Ryan and I would both be interested in any reviews or comments. If you end up using the tag we'd love to hear some follow-up on how it is being used.
